

# Case Study

## IMPORTANT

Due to a governing confidentiality agreement, we've refrained from disclosing actual client and solution names. These have been changed appropriately, to more generic sounding terms and nomenclatures.

### Platform:

Blackberry/ Windows Mobile

### Industry:

Medicine

### Business Challenge:

The client wanted to develop an application for the doctors who could actually store all relevant information about their patients, cases and the diagnosis which could actually save lot of time and effort for doctors in long run.

### Software Solution:

We developed the application taking into consideration the doctors' requirements, who would be the actual users of the application. The application has been divided into two parts, client side resides at the user handset and the other is at the server side. When doctor logs in with username and password it goes for the verification at server side and when it is authenticated the doctor can start using the application.

### Features:

- Can add/delete patients.
- Can add or edit information on patients and cases.
- Can add diagnosis of the patients done.
- Has the feature to see each screen separately like patient screen, case screen, message screen & synchronization screen.
